

THE PROBLEM & THE PLATFORM

What FaiykeOS is and why it exists

Your AI. Your Data. Your Rules.

The Problem It Solves

Most businesses using AI end up with a fragmented mess — one tool for chat, another for automation, manual copy-paste between systems, no audit trail, no memory across sessions, no control over who sees what. Every conversation starts from zero. Every output lives somewhere random. **FaiykeOS fixes this.**

What FaiykeOS Is

FaiykeOS is an AI Operating System — a private, self-hosted control center that unifies AI agents, automated workflows, persistent memory, and client management into one authenticated platform.

Think of it as your own private AI brain: it **remembers everything**, executes work autonomously, routes tasks to the right agent, and delivers outputs you can track, search, and export — all behind a secure login. Built on **Claude Sonnet** (Anthropic's flagship model), it runs entirely on your infrastructure. No data leaves to a third party.

Who It's For

Who	How They Use It
Agencies	Isolated AI workspace per client — white-labeled with client branding
Businesses	AI agents doing real operational work: analysis, research, briefings, reports
Teams	Role-based access — admins, operators, clients, viewers all scoped correctly

The Core Capability Stack

Layer	What It Does
AI Agent Registry	12 specialized agents — analysis, research, briefing, writing, client management. Streaming responses. Every run scored for quality automatically.
Memory Engine	Hybrid BM25 + vector search (RAG). Agents remember your business, clients, and history across every session. Memory consolidates automatically every 4 hours.
Workflow Automation	7 pre-built pipelines. Schedule on a cron, trigger via webhook from any external tool, or run on demand. No human in the loop required.
Client Vault	Each client gets a namespace-isolated workspace. Their data never touches another client's data.
Output Manager	Every AI output is tagged, saved, full-text searchable, and exportable across all historical sessions.
Ticketing System	Built-in task tracker with SLA tiers, staff assignment, and email notifications.

THE PLATFORM IN PRACTICE

Dashboard, security, comparison, pricing

From login to delivered output — no human in the loop.

The Dashboard — Role-Based Experience

Users log into a branded web interface that adapts entirely by role. Every client sees only their namespace: their AI runs, their outputs, their usage stats, their tickets. A **Namespace Pulse Score** (0–100 composite) shows namespace health at a glance.

Role	What They See
Admin	Everything — agents, workflows, memory, vaults, audit logs, user management, system observability
Operator	All namespaces: run agents + workflows; no user management access
Client	Own namespace only: AI runs, outputs, usage dashboard, tickets, Pulse Score
Viewer	Own namespace, read-only
Staff	Assigned tickets only

A Day in the Platform

Step	What Happens
1 Login	Client logs in to their branded dashboard — company colors, name, and logo.
2 Run Agent	Submit a request to the Analysis Agent. Streaming response in seconds, saved automatically to output history.
3 Automation	Workflow Engine fires a scheduled morning briefing. No human trigger needed.
4 Tickets	A task is raised; assigned staff notified by email; SLA clock starts.
5 Export	At end of week, client exports all outputs as a report. Full history searchable.

FaiykeOS vs Generic AI Tools

Generic AI (ChatGPT etc.)	FaiykeOS
No memory between sessions	Persistent hybrid RAG memory — agents remember context
Single user, single conversation	Multi-user, role-based, namespace-isolated
No audit trail	Full audit log on every action, every run
No automation	7 workflows + webhook triggers + cron scheduling
Data sent to external servers	Self-hosted — your data never leaves your machine

No client management	White-labeled per client with usage dashboards
No quality control	Every AI response scored by LLM-as-Judge automatically

Security & Reliability

- JWT authentication — 60-minute access tokens, 24-hour session window, bcrypt password hashing
- Account lockout after 5 failed attempts · All routes require authentication
- Rate limiting, CORS controls, full security response headers on every API response
- Automatic daily database backup with 7-backup retention
- 115 automated tests in the test suite · Zero public endpoints except /health

Pricing

Tier	Price	Best For
Developer	\$197 one-time	Solo operator, personal use
Business	\$997 + \$147/mo	Small team, 1–3 client namespaces
Agency	\$997 flat or \$497+\$97/mo	Unlimited client namespaces + reseller rights

“FaiykeOS gives you a private AI command center — your agents, your memory, your clients, your workflows — running on your terms, not a third party’s.”
